The MD4 Message Digest Algorithm

Status of this Memo

This RFC is the specification of the MD4 Digest Algorithm. If you are going to implement MD4, it is suggested you do it this way. This memo is for informational use and does not constitute a standard.

Distribution of this memo is unlimited.

1. Abstract

This note describes the MD4 message digest algorithm. The algorithm takes as input an input message of arbitrary length and produces as output a 128-bit "fingerprint" or "message digest" of the input. It is conjectured that it is computationally infeasible to produce two messages having the same message digest, or to produce any message having a given prespecified target message digest. The MD4 algorithm is thus ideal for digital signature applications, where a large file must be "compressed" in a secure manner before being signed with the RSA public-key cryptosystem.

The MD4 algorithm is designed to be quite fast on 32-bit machines.

On a SUN Sparc station, MD4 runs at 1,450,000 bytes/second. On a DEC MicroVax II, MD4 runs at approximately 70,000 bytes/second. On a 20MHz 80286, MD4 runs at approximately 32,000 bytes/second. In addition, the MD4 algorithm does not require any large substitution tables; the algorithm can be coded quite compactly.

The MD4 algorithm is being placed in the public domain for review and possible adoption as a standard.

Rivest [Page 1]

RFC 1186 MD4 Message Digest Algorithm October 1990

(Note: The document supersedes an earlier draft. The algorithm described here is a slight modification of the one described in the draft.)

2. Terminology and Notation

In this note a "word" is a 32-bit quantity and a byte is an 8-bit quantity. A sequence of bits can be interpreted in a natural manner as a sequence of bytes, where each consecutive group of 8 bits is interpreted as a byte with the high-order (most significant) bit of each byte listed first. Similarly, a sequence of bytes can be interpreted as a sequence of 32-bit words, where each consecutive group of 4 bytes is interpreted as a word with the low-order (least significant) byte given first.

Let x_i denote " x sub i ". If the subscript is an expression, we surround it in braces, as in x_{i+1} . Similarly, we use $^$ for superscripts (exponentiation), so that x^i denotes x to the i -th power.

Let the symbol $+$ denote addition of words (i.e., modulo- 2^{32} addition). Let $X \lll s$ denote the 32-bit value obtained by circularly shifting (rotating) X left by s bit positions. Let $\text{not}(X)$ denote the bit-wise complement of X , and let $X \vee Y$ denote the bit-wise OR of X

and Y . Let $X \text{ xor } Y$ denote the bit-wise XOR of X and Y , and let XY denote the bit-wise AND of X and Y .

3. MD4 Algorithm Description

We begin by supposing that we have a b -bit message as input, and that we wish to find its message digest. Here b is an arbitrary nonnegative integer; b may be zero, it need not be a multiple of 8, and it may be arbitrarily large. We imagine the bits of the message written down as follows:

$m_0 m_1 \dots m_{b-1}$.

The following five steps are performed to compute the message digest of the message.

Step 1. Append padding bits

The message is "padded" (extended) so that its length (in bits) is congruent to 448, modulo 512. That is, the message is extended so that it is just 64 bits shy of being a multiple of 512 bits long. Padding is always performed, even if the length of the message is already congruent to 448, modulo 512 (in which case 512 bits of padding are added).

Rivest [Page 2]

RFC 1186 MD4 Message Digest Algorithm October 1990

Padding is performed as follows: a single "1" bit is appended to the message, and then enough zero bits are appended so that the length in bits of the padded message becomes congruent to 448, modulo 512.

Step 2. Append length

A 64-bit representation of b (the length of the message before the padding bits were added) is appended to the result of the previous step. In the unlikely event that b is greater than 2^{64} , then only the low-order 64 bits of b are used. (These bits are appended as two 32-bit words and appended low-order word first in accordance with the previous conventions.)

At this point the resulting message (after padding with bits and with b) has a length that is an exact multiple of 512 bits.

Equivalently, this message has a length that is an exact multiple of 16 (32-bit) words. Let $M[0 \dots N-1]$ denote the words of the resulting message, where N is a multiple of 16.

Step 3. Initialize MD buffer

A 4-word buffer (A, B, C, D) is used to compute the message digest. Here each of A, B, C, D are 32-bit registers. These registers are initialized to the following values in

hexadecimal, low-order bytes first):

word A: 01 23 45 67

word B: 89 ab cd ef

word C: fe dc ba 98

word D: 76 54 32 10

Step 4. Process message in 16-word blocks

We first define three auxiliary functions that each take as input three 32-bit words and produce as output one 32-bit word.

$f(X,Y,Z) = XY \vee \text{not}(X)Z$

$g(X,Y,Z) = XY \vee XZ \vee YZ$

$h(X,Y,Z) = X \text{ xor } Y \text{ xor } Z$

In each bit position f acts as a conditional: if x then y else z . (The function f could have been defined using $+$ instead of \vee since XY and $\text{not}(X)Z$ will never have 1's in the same bit position.) In each bit position g acts as a majority function: if at least two of x, y, z are on, then g has a one in that bit position, else g has a zero. It is interesting to note that if Rivest [Page 3]

RFC 1186 MD4 Message Digest Algorithm October 1990

the bits of X, Y , and Z are independent and unbiased, then each bit of $f(X,Y,Z)$ will be independent and unbiased, and similarly each bit of $g(X,Y,Z)$ will be independent and unbiased. The function h is the bit-wise "xor" or "parity" function; it has properties similar to those of f and g .

Do the following:

For $i = 0$ to $N/16-1$ do /* process each 16-word block */

For $j = 0$ to 15 do: /* copy block i into X */

Set $X[j]$ to $M[i*16+j]$.

end /* of loop on j */

Save A as AA , B as BB , C as CC , and D as DD .

[Round 1]

Let $[A \ B \ C \ D \ i \ s]$ denote the operation

$A = (A + f(B,C,D) + X[i]) \lll s$.

Do the following 16 operations:

$[A \ B \ C \ D \ 0 \ 3]$

$[D \ A \ B \ C \ 1 \ 7]$

$[C \ D \ A \ B \ 2 \ 11]$

$[B \ C \ D \ A \ 3 \ 19]$

$[A \ B \ C \ D \ 4 \ 3]$

[D A B C 5 7]

[C D A B 6 11]

[B C D A 7 19]

[A B C D 8 3]

[D A B C 9 7]

[C D A B 10 11]

[B C D A 11 19]

[A B C D 12 3]

[D A B C 13 7]

[C D A B 14 11]

[B C D A 15 19]

[Round 2]

Let $[A\ B\ C\ D\ i\ s]$ denote the operation

$A = (A + g(B,C,D) + X[i] + 5A827999) \lll s$.

(The value 5A..99 is a hexadecimal 32-bit constant, written with the high-order digit first. This constant represents the square root of 2. The octal value of this constant is 013240474631. See Knuth, The Art of Programming, Volume 2 (Seminumerical Algorithms), Second Edition (1981), Addison-Wesley. Table 2, page 660.)

Do the following 16 operations:

[A B C D 0 3]

Rivest [Page 4]

RFC 1186 MD4 Message Digest Algorithm October 1990

[D A B C 4 5]

[C D A B 8 9]

[B C D A 12 13]

[A B C D 1 3]

[D A B C 5 5]

[C D A B 9 9]

[B C D A 13 13]

[A B C D 2 3]

[D A B C 6 5]

[C D A B 10 9]

[B C D A 14 13]

[A B C D 3 3]

[D A B C 7 5]

[C D A B 11 9]

[B C D A 15 13]

[Round 3]

Let [A B C D i s] denote the operation

$$A = (A + h(B, C, D) + X[i] + 6ED9EBA1) \lll s.$$

(The value 6E..A1 is a hexadecimal 32-bit

constant, written with the high-order digit

first. This constant represents the square

root of 3. The octal value of this constant

is 015666365641. See Knuth, The Art of

Programming, Volume 2 (Seminumerical

Algorithms), Second Edition (1981),

Addison-Wesley. Table 2, page 660.)

Do the following 16 operations:

[A B C D 0 3]

[D A B C 8 9]

[C D A B 4 11]

[B C D A 12 15]

[A B C D 2 3]

[D A B C 10 9]

[C D A B 6 11]

[B C D A 14 15]

[A B C D 1 3]

[D A B C 9 9]

[C D A B 5 11]

[B C D A 13 15]

[A B C D 3 3]

[D A B C 11 9]

[C D A B 7 11]

[B C D A 15 15]

Then perform the following additions:

$$A = A + AA$$

$$B = B + BB$$

Rivest [Page 5]

RFC 1186 MD4 Message Digest Algorithm October 1990

$$C = C + CC$$

$$D = D + DD$$

(That is, each of the four registers is incremented by

the value it had before this block was started.)

end /* of loop on i */

Step 5. Output

The message digest produced as output is A,B,C,D. That is, we begin with the low-order byte of A, and end with the high-order byte of D.

This completes the description of MD4. A reference implementation in C is given in the Appendix.

4. Extensions

If more than 128 bits of output are required, then the following procedure is recommended to obtain a 256-bit output. (There is no provision made for obtaining more than 256 bits.)

Two copies of MD4 are run in parallel over the input. The first copy is standard as described above. The second copy is modified as follows.

The initial state of the second copy is:

word A: 00 11 22 33

word B: 44 55 66 77

word C: 88 99 aa bb

word D: cc dd ee ff

The magic constants in rounds 2 and 3 for the second copy of MD4 are changed from $\sqrt{2}$ and $\sqrt{3}$ to $\sqrt[3]{2}$ and $\sqrt[3]{3}$:

Octal Hex

Round 2 constant 012050505746 50a28be6

Round 3 constant 013423350444 5c4dd124

Finally, after every 16-word block is processed (including the last block), the values of the A registers in the two copies are exchanged.

The final message digest is obtained by appending the result of the second copy of MD4 to the end of the result of the first copy of MD4.

Rivest [Page 6]

RFC 1186 MD4 Message Digest Algorithm October 1990

5. Summary

The MD4 message digest algorithm is simple to implement, and provides a "fingerprint" or message digest of a message of arbitrary length.

It is conjectured that the difficulty of coming up with two messages having the same message digest is on the order of 2^{64} operations, and that the difficulty of coming up with any message having a given message digest is on the order of 2^{128} operations. The MD4 algorithm has been carefully scrutinized for weaknesses. It is, however, a relatively new algorithm and further security analysis is of course justified, as is the case with any new proposal of this sort. The level of security provided by MD4 should be sufficient for

implementing very high security hybrid digital signature schemes based on MD4 and the RSA public-key cryptosystem.

6. Acknowledgements

I'd like to thank Don Coppersmith, Burt Kaliski, Ralph Merkle, and Noam Nisan for numerous helpful comments and suggestions.

Security Considerations

The level of security discussed in this memo by MD4 is considered to be sufficient for implementing very high security hybrid digital signature schemes based on MD4 and the RSA public-key cryptosystem.
